Great. Any idea on the percentage of total flow from the other community?

Hello Marc,

1.) We service another community at our wastewater plant

2.) I'll get with the wastewater plant on this

3.) Sludge from drinking water plant goes to various locations. Lime sludge goes to a lagoon and the plate settler/primary settling sludge (ferric chloride) goes to the wastewater plant

Hi Rob,

Do you have this information for me?

I basically had the following questions:

- 1) Does the sewage to your wastewater plant come only from Flint, or is some percentage of it from outside Flint?
- 2) Does the city have Zinc/Iron data for the biosolids?
- 3) Does sludge from the potable water plant (when in operation) go to the sewer, or is that handled separately?

Marc

Marc and Rob,

I am sending this email as a virtual introduction.

Rob,

There are some questions that Marc has with respect to the Biosolids data that you provided and I thought it might be more expedient if you and he were to communicate directly with each other. Some of the questions that Marc has are:

Does the City have Zinc/Iron data for the biosolids?

Is the sewer in Flint Combined?

I would also be happy to engage in future communications regarding this issue if my participation is felt to be beneficial.

Thank you both.

George
